

# Building A Model

Do you remember the good old days when we had one dependent variable and one independent variable.

1461 people have written a note here.

# Building A Model

1)

2)

1461 people have written a note here.

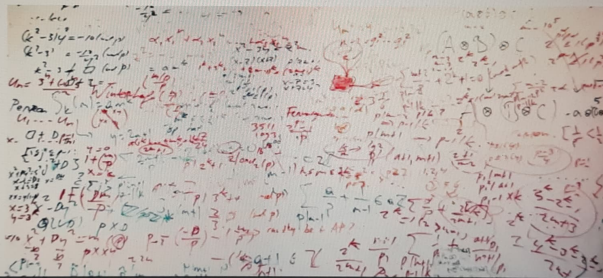

Number one is garbage in garbage out.

# Building A Model

1)

2)

the not just the math behind them but actually what it means that  
certain variables predict the behavior

# Building A Model

## 5 methods of building models:

1. All-in
2. Backward Elimination
3. Forward Selection
4. Bidirectional Elimination
5. Score Comparison

We're going to talk about each one of them just now before we do

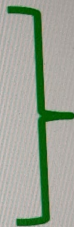

I wanted to say that sometimes you'll

# Building A Model

## 5 methods of building models:

1. All-in
  2. Backward Elimination
  3. Forward Selection
  4. Bidirectional Elimination
  5. Score Comparison
- 
- Stepwise Regression

OK so let's move on to our methods.

# Building A Model

## "All-in" – cases:

- Prior knowledge; OR
- You have to; OR
- Preparing for Backward Elimination

1820 people have written a note here.

of regression which is our next type.

# Building A Model

## Backward Elimination

**STEP 1:** Select a significance level to stay in the model (e.g.  $SL = 0.05$ )

**STEP 2:** Fit the full model with all possible predictors

**STEP 3:** Consider the predictor with the highest P-value. If  $P > SL$ , go to STEP 4, otherwise go to FIN

**STEP 4:** Remove the predictor

**STEP 5:** Fit model without this variable\*

**FIN:** Your Model Is Ready

So as soon as all of the variables that you have left in your model  
are there p values are less than

1820 people have written a note here.

# Building A Model

## Forward Selection

**STEP 1:** Select a significance level to enter the model (e.g.  $SL = 0.05$ )

**STEP 2:** Fit all simple regression models  $y \sim x_n$ . Select the one with the lowest P-value

**STEP 3:** Keep this variable and fit all possible models with one extra predictor added to the one(s) you already have

**STEP 4:** Consider the predictor with the lowest P-value. If  $P < SL$ , go to STEP 3, otherwise go to FIN

And that makes sense because you've just added a variable which your model is insignificant. So what's the point?

1820 people have written a note here.

# Building A Model

## Bidirectional Elimination

**STEP 1:** Select a significance level to enter and to stay in the model  
e.g.:  $SLENTER = 0.05$ ,  $SLSTAY = 0.05$

**STEP 2:** Perform the next step of Forward Selection (new variables must have:  $P < SLENTER$  to enter)

**STEP 3:** Perform ALL steps of Backward Elimination (old variables must have  $P < SLSTAY$  to stay)

**STEP 4:** No new variables can enter and no old variables can exit

You can add anything you can take anything out that means  
you've created the model.

1820 people have written a note here.

# Building A Model

## All Possible Models

**STEP 1:** Select a criterion of goodness of fit (e.g. Akaike criterion)

**STEP 2:** Construct All Possible Regression Models:  $2^N - 1$  total combinations

**STEP 3:** Select the one with the best criterion

**FIN:** Your Model Is Ready

**Example:**  
**10 columns means**  
**1,023 models**

So sounds easy but let's have a look an example even if you have

1820 people have written a note here.

10 columns in your daughter you'll

# Building A Model

## 5 methods of building models:

1. All-in
2. Backward Elimination
3. Forward Selection
4. Bidirectional Elimination
5. Score Comparison

And plus we'll throw in a few extra tricks along the way to make sure our models are very robust Cant' wait
